

# Metric stress matrix: same image or layout impostor?

Generated anchors from the 3.91-FID latent-ablation checkpoint; desired behavior is weak view close, layout impostors far.

## A Visual probes

## B Aggregate metric response

128 generated anchors; pair accuracy asks whether the weak view is closer than the impostor.

| Trap family        | Acc. ↑ | Acc. ↑ | Margin ↑ | Margin ↑ |
|--------------------|--------|--------|----------|----------|
|                    | Euc    | MS     | Euc      | MS       |
| Roll mix           | 91%    | 100%   | 0.21     | 0.29     |
| Patch shuffle      | 98%    | 100%   | 0.30     | 0.35     |
| Euc-mined impostor | 70%    | 97%    | 0.08     | 0.18     |
| Average            | 86%    | 99%    | 0.20     | 0.27     |

Higher is better for both pair accuracy and margin.

The mined impostor is selected from 96 roll/shuffle variants by Euclidean distance; both metrics then score the same candidate.

MS-stat improves the mined-impostor pair accuracy by 27 percentage points.
